

## Past $\lambda T = 1$ , more requests mean fewer misses per object

Misses of one object per characteristic time,  $\lambda T \cdot \exp(-\lambda T)$ , and where the agentic objects sit at 12 and 36 agentic req/s, for three reachable-set sizes.

Misses per object per characteristic time,  $\lambda T \cdot \exp(-\lambda T)$

Source: post-hoc characteristic-time calculation with the generator's access distribution; measured marginals from the testbed, mean of 5 repetitions.
